

LEAD IN SOLVENT-BASED PAINTS FOR HOME USE IN THE REPUBLIC OF MOLDOVA

English Summary

October 2016

a toxics-free future

IPEN is a leading global network of non-governmental organizations (NGOs) working in more than 100 developing countries and countries with economies in transition. IPEN works to establish and implement safe chemicals policies and practices to protect human health and the environment. It does this by building the capacity of its member organizations to implement on-the-ground activities, learn from each other's work, and work at the international level to set priorities and achieve new policies. Its mission is a toxics-free future for all.

IPEN has been engaged in the SAICM process since 2003, and its global network helped to develop the SAICM international policy framework. At its founding, in 1998, IPEN focused on advancing the development and implementation of the Stockholm Convention on persistent organic pollutants (POPs). Today, its mission also includes promoting safe chemicals management through the SAICM process (where it holds the public interest organization seat on the SAICM Bureau), halting the spread of toxic metals, and building a movement for a toxics-free future.

PREFACE AND ACKNOWLEDGEMENTS

In 2007 and 2008, NGOs in the IPEN network collected and analyzed decorative (home use) paints on the market in 11 developing countries, and in countries with economies in transition. The results were startling. In every one of these countries, many of the paints contained dangerously high lead levels. In response, IPEN launched its Global Lead Paint Elimination Campaign, which seeks to eliminate lead paint by 2020 and raise widespread awareness among business entrepreneurs and consumers about the adverse human health impacts of lead paint, particularly on the health of children. Since then, IPEN-affiliated NGOs and others have sampled and analyzed paints on the market in approximately 40 low- and middle-income countries.

These and other studies suggest that lead paints for home use continue to be widely produced, sold, and used in developing countries even though most highly industrial countries banned lead paints for household use more than 40 years ago.

This report presents new data on the total lead content of solvent-based paints for home use available on the market in the Republic of Moldova. It also presents background information on why the use of lead paint is a source of serious concern, especially to children's health; a review of national policy frameworks that are in place to ban or restrict the manufacture, import, export, distribution, sale and use of lead paint; and a strong justification to adopt and enforce further regulatory controls in the Republic of Moldova. Finally, it proposes action steps by different stakeholders to protect children and others from lead paint.

We take this opportunity to thank all those who were instrumental in compiling and shaping this paint study: primarily Sara Brosché, Manny Calonzo, Valerie Denney, Jeiel Guarino, and Jack Weinberg from IPEN; Olga Speranskaya from Eco-Accord; Tatiana Biresova, Jindřich Petrлік, and Jitka Straková from Arnika; as well as to the staff of Forensic Analytical Laboratories, Inc. USA.

This study was undertaken as part of IPEN's Global Lead Paint Elimination Campaign. It was conducted in the Republic of Moldova by EcoCon-

tact in partnership with IPEN, and funded by the New York Community Trust (NYCT) and the Swedish Government.

While this study was undertaken with funding assistance from the New York Community Trust and the Swedish Government, responsibility for the content lies entirely with IPEN and EcoContact. The New York Community Trust and the Swedish Government do not necessarily share the expressed views and interpretations.

IPEN is an international NGO network of health and environmental organizations from all regions of the world of which EcoContact is a member. IPEN is a leading global organization working to establish and implement safe chemicals policies and practices to protect human health and the environment. Its mission is a toxics-free future for all. IPEN helps build the capacity of its member organizations to implement on-the-ground activities, learn from each other's work, and work at the international level to set priorities and achieve new policies.

The public association EcoContact is registered in Moldova in 2010. EcoContact is involved in several environmental and civil society issues such as public participation and access to information on environmental matters; waste management, toxic wastes, and water; soil remediation; disaster risk reduction and vulnerability; drafting and implementation of local and national environmental legislations; establishing multi-stakeholder partnership and cooperation; and participation in international fora on environmental issues. EcoContact is an IPEN member since 2015.

EcoContact is member of POPs, PRTR, SAICM, Aarhus and Green Economy Working Groups organized by the Government/Ministry of Environment of Moldova. EcoContact actively participates in development, coordination, and consultation of public policies, and contribute to public participation, information dissemination and support access to justice on environmental matters (real cases in court). EcoContact was a member of the official delegation of Moldova at Rio+20, participated in Environment for Europe Process, and registered for Batumi Ministerial, Georgia, in June 2016.

BACKGROUND

Lead is a toxic metal that causes adverse effects on both human health and the environment. While lead exposure is also harmful to adults, lead exposure harms children at much lower levels, and the health effects are generally irreversible and can have a lifelong impact.

The younger the child, the more harmful lead can be, and children with nutritional deficiencies absorb ingested lead at an increased rate. The human fetus is the most vulnerable, and a pregnant woman can transfer lead that has accumulated in her body to her developing child.¹ Lead is also transferred through breast milk when lead is present in a nursing mother.²

Evidence of reduced intelligence caused by childhood exposure to lead has led the World Health Organization (WHO) to list “lead-caused mental retardation” as a recognized disease. WHO also lists it as one of the top ten diseases whose health burden among children is due to modifiable environmental factors.

Lead paint is a major source of childhood lead exposure. The term lead paint is used in this report to describe any paint to which one or more lead compounds have been added. The cut-off concentration for lead paint used in the report is 90 parts per million (ppm, dry weight of paint), the strictest legal limit enacted in the world today.

A recent study investigating the economic impact of childhood lead exposure on national economies in all low- and middle-income countries estimated a total cumulative cost burden of \$977 billion international dollars³ per year.

Most highly industrial countries adopted laws or regulations to control the lead content of decorative paints—the paints used on the interiors and

3 An international dollar is a currency unit used by economists and international organizations to compare the values of different currencies. It adjusts the value of the U.S. dollar to reflect currency exchange rates, purchasing power parity [PPP], and average commodity prices within each country. According to the World Bank, “An international dollar has the same purchasing power over GDP as the U.S. dollar has in the United States.” The international dollar values in this report were calculated from a World Bank table that lists GDP per capita by country based on purchasing power parity and expressed in international dollars.

exteriors of homes, schools, and other child-occupied facilities—beginning in the 1970s and 1980s. In Moldova, there is currently no regulation in place limiting the amount of lead in paint for household and decorative use. The Government of Moldova approved the National Chemicals Profile (2008) and the Program on Sustainable Use of Chemicals (2010). The Ministry of Environment developed the draft law on chemicals, in which heavy metals and toxic chemicals like lead are listed to be restricted or their use banned. Due to an unstable political situation during the last two years, this draft law was not promoted. However, the Government supports NGO initiatives, which highlight priority issues and support the promotion of legal or strategic documents in toxic chemicals management. Government representatives were also engaged in stakeholder consultations during a recent UN Environment funded project executed by EcoContact during 2016, with the aim of supporting the development of regulatory controls on lead in paint in the Republic of Moldova.

From July to August 2016, EcoContact purchased a total of 28 cans of solvent-based paint intended for home use from stores in Chisinau, Republic of Moldova. The paints represented 12 different brands produced by 12 manufacturers. All paints were analyzed by an accredited laboratory in the United States of America for their total lead content, based on dry weight of the paint. The paint samples were analyzed using method EPA3050B/7420, i.e., through acid digestion of the samples, followed by Flame Atomic Absorption Spectrometry, as recognized by the WHO as appropriate for the purpose.⁴ The laboratory participates in the Environmental Lead Proficiency Analytical Testing (ELPAT) program operated by the American Industrial Hygiene Association (AIHA), assuring the reliability of the analytical results.

⁴ World Health Organization, *Brief guide to analytical methods for measuring lead in paint*. 2011, WHO Library Cataloguing-in-Publication Data.

RESULTS

16 out of 28 analyzed solvent-based paints for home use [57 percent of paints] were lead paints, i.e., they contained a total lead concentration above 90 parts per million (ppm, dry weight of paint). This is also the regulatory limit for lead in decorative paint in the Philippines, Nepal and the United States of America. In addition, 10 out of 28 analyzed solvent-based paints for home use [36 percent of paints] contained a total lead concentration above 600 ppm – the regulatory limit for lead in decorative paint in South Africa, Brazil and Sri Lanka.

5 paints [18 percent of paints] contained dangerously high lead concentrations above 10,000 ppm. The highest total lead concentration detected was 83,000 ppm in a red alkyd paint sold for home use.

On the other hand, 12 out of 28 solvent-based paints for home use [43 percent of paints] contained total lead concentrations at, or below 90 ppm, suggesting that the technology exists to produce paint without lead ingredients.

7 out of 12 analyzed brands [58 percent of paint brands] sold at least one lead paint, i.e., a paint with total lead concentration above 90 ppm. 4 out of 12 analyzed brands [33 percent of paint brands] sold at least one lead paint with dangerously high lead concentrations above 10,000 ppm.

Paints containing lead above 90 ppm were manufactured in Bulgaria, Moldova, Russia, and Ukraine. The highest lead concentration detected was 83,000 ppm in a red Si Belle Alkyd Paint sold for home use. This paint was manufactured in Bulgaria.

Yellow and red paints most frequently contained dangerously high lead concentrations above 10,000 ppm. Of 9 yellow paints, 4 [44 percent of yellow paints] contained lead levels above 10,000 ppm, and of 8 red paints, 1 [12 percent of red paints] contained lead levels above 10,000 ppm.

The ten solvent-based paints with the highest amounts of lead are summarized in Table 1.

TABLE 1. TOP 10 SOLVENT-BASED PAINTS WITH THE HIGHEST LEAD CONTENT.

Rank	Sample No.	Brand	Manufacturer (Country of Manufacture)	Color	Lead Content (ppm)
1	MOL-18	Si Belle	Ninachim (Bulgaria)	red	83,000
2	MOL-17	Si Belle	Ninachim (Bulgaria)	yellow	35,000
3	MOL-20	Khimrezerv	Khimrezerv (Ukraine)	yellow	23,000
4	MOL-23	Palitra	Cheton Group (Moldova)	yellow	16,000
5	MOL-14	Paritet	Rolax (Ukraine)	yellow	14,000
6	MOL-15	Paritet	Rolax (Ukraine)	red	6,300
7	MOL-22	Palitra	Cheton Group (Moldova)	white	1,500
8	MOL-01	Rastsvet	Empils (Russia)	white	1,400
9	MOL-03	Rastsvet	Empils (Russia)	red	1,000
10	MOL-02	Rastsvet	Empils (Russia)	yellow	930

In general, paint can labels did not carry meaningful information about lead content or the hazards of lead paint. No paints provided information about lead on their labels and most paints carried little information about any ingredients on can labels. Most paints were merely labeled as “solvents, pigments and resin,” with no further details on the type of solvents and pigments [organic or inorganic] provided on paint can labels. Manufacturing dates or batch numbers were included on the labels of all 28 paints [100 percent of paints] included in this study. Most warning symbols on the paint cans indicated the flammability of the paints, but had no precautionary warnings on the effects of lead dust to children and pregnant women were provided.

CONCLUSIONS

This study demonstrates that solvent-based paints for home use with high concentrations of lead are widely available in the Republic of Moldova since the paints included in this study were from brands commonly sold in retail stores all over Moldova. However, the fact that 12 out of 28 paints [43 percent of paints] contained lead concentrations below 90 ppm indicates that the technology to produce paints without added lead exists in Moldova. The study results provide a strong justification to adopt and enforce a regulation that will ban the manufacture, import, export, distribution, sale and use of paints with total lead concentrations greater than 90 ppm.

RECOMMENDATIONS

To address the problem of lead in paint, EcoContact and IPEN propose the following recommendations:

Government and Government Agencies

The Government of the Republic of Moldova should immediately draft a regulation that will ban the manufacture, import, export, distribution, sale and use of paints that contain total lead concentrations exceeding 90 ppm, the most restrictive standard in the world. They should also require paint companies to display sufficient information indicating harmful content on paint can labels such as solvents and provide a warning on possible lead dust hazards when disturbing painted surfaces.

Paint Industry

Paint companies that still produce lead paints should expeditiously stop the use of leaded paint ingredients in paint formulations. Paint companies that have shifted to non-lead paint production should get their products certified through independent, third party verification procedures to increase the customer's ability to choose paints with no added lead.

Individual, Household and Institutional Consumers

Paint consumers should demand paints with no added lead from paint manufacturers and retailers, as well as full disclosure of a paint product's

lead content. Household and institutional consumers should ask for, consciously buy, and apply only paints with no added lead in places frequently used by children such as homes, schools, day care centers, parks and playgrounds.

Organizations and Professional Groups

Public health groups, consumer organizations and other concerned entities should support the elimination of lead paint, and conduct activities to inform and protect children from lead exposure through lead paint, lead in dust and soil, and other sources of lead.

All Stakeholders

All stakeholders should come together and unite in promoting a strong policy that will eliminate lead paint in Moldova.
